BLM BENDING AND ENDFORMING

Bending a pre-assembled tubular component with a bend angle of 185°.

The straight tube is first endformed, the aluminium fitting is mounted and locked into position, and then a rotary forming operation is carried out. Bending to an angle of 185° which requires specially designed tooling to facilitate loading and unloading of the finished components.

Advantages:

- greater feasibility for components with complex bends
- simple production flow with zero part accumulation
- secondary operations such as brazing and welding eliminated
- higher repeatability and final part quality

Our technical sales staff is at your complete disposal for further information or to arrange a demonstration. Contact BLM tel. +39 031 7070200 • e-mail: export@blm.it • www.blmgroup.com
